

## NanoLite: World's Smallest Adhesive Light

Sometimes a product comes along that is just so simple that it's smart. The NanoLite is one such product.

The NanoLite is the world's smallest adhesive light. It was designed by a woman who sought a simple solution to an everyday problem -- fumbling with her keys in the dark. And it works. The operating life for NanoLite is three years, with a shelf life of 10.

The peel-and-press technology used on the back side of the light allows you to effortlessly attach NanoLite to keys and other items.

What makes the product genius is the fact that you don't have to fumble around with a key chain flashlight while trying to stick your key in the door. You just press the button on the NanoLite, which is already attached to the face of your key, and press the button for the infrared light.

It's super simple, sleek, and the adhesive is strong, so you won't have to worry about the light falling off your key. And better yet, it's only \$2.99 and available online at [www.januaryinnovations.com](http://www.januaryinnovations.com) or [www.amazon.com](http://www.amazon.com) key word "nanolite."
